

The provided sources offer a comprehensive guide to **building, documenting, and legally distributing GitHub Actions**, with a specific focus on **Docker container actions**. They detail the essential technical components, including **Dockerfile creation**, **shell script entrypoints**, and the **YAML-based metadata syntax** required to define inputs and outputs. Beyond technical implementation, the texts introduce **automation tools** like GitHub Actions Auto-Docs, which simplify the creation of README files by extracting data directly from configuration files. Security is emphasized as a critical priority, highlighting the need to protect against **malicious script injections** and handle **untrusted input** with caution. Finally, the sources outline the **GitHub Marketplace Developer Agreement**, establishing the legal and financial frameworks for developers to share or sell their custom automations. Overall, these documents serve as a roadmap for navigating the full lifecycle of **custom automation development** within the GitHub ecosystem.
